

# Your Grass Can Be Greener

Water-Efficient Landscapes Start With  
Certified Irrigation Professionals

**W**aterSense®, a program sponsored by the U.S. Environmental Protection Agency, is dedicated to improving national water efficiency. This partnership program seeks to help homeowners and businesses improve water efficiency and reduce costs by promoting efficient irrigation technologies, as well as water-efficient products for the home and garden.

Having a beautiful landscape doesn't have to mean wasting water or money. WaterSense aims to take some of the guesswork out of watering your yard by making it easy to find water-efficient technologies and services. As part of this goal, WaterSense recognizes professional certification programs that advance water-efficient irrigation techniques and practices.

WaterSense makes it easy to find water-efficient products and services. If you're looking for an irrigation system designer, installation/maintenance specialist, or auditor for your landscape watering system, visit the directory of WaterSense irrigation partners on the WaterSense Web site to ensure the individual has received instruction and testing on water-efficient techniques and practices.

Individuals who have successfully completed a WaterSense labeled certification program must demonstrate professional competency in water-efficient irrigation practices.

WaterSense labeled certification programs:

- Verify professional proficiency in water-efficient irrigation system design, installation and maintenance, and performance audits.
- Test designers, installation/maintenance professionals, and auditors on their water-efficiency knowledge through examinations.
- Certify only experienced irrigation system designers and installation/maintenance professionals.
- Require independent oversight.
- Demonstrate awareness of recent technology and innovations.

Consulting an irrigation professional certified through a WaterSense labeled program can save water, time, and money. Ask your irrigation professional about water-saving technologies, such as weather-based irrigation controllers and moisture sensors, available for your outdoor watering system. Even more important, conduct regular checks and maintenance of your system to ensure ongoing water efficiency. A certified irrigation professional with proven knowledge of water-efficient technologies and practices can help you design, test, and maintain an effective watering system for your yard and garden.

Certified irrigation auditors can conduct uniformity tests to ensure that your lawn is evenly watered.

# Don't let an inefficient irrigation system control your water bill!

**Did you know** that 30 percent of the water used by the average American household is devoted to outdoor water use? In some parts of the country, homeowners use as much as 70 percent of their water outdoors. Some experts estimate that up to 50 percent of landscape water use goes to waste due to evaporation, wind, or runoff caused by overwatering!

Following are some simple tips for homeowners to reduce their outdoor water use dramatically:

- Using weather-based irrigation scheduling on a moderate-sized yard can save about 30 gallons of water per day.
- The best time to water your yard is early morning, when winds are calm and temperatures are cool.
- Grass doesn't need to be watered every day; make sure your lawn really needs it before irrigating. If you can stick a screwdriver into your lawn easily—don't water!
- Irrigation system maintenance varies depending on the system, but it is always a good idea to inspect your system monthly to prevent leaks, broken or clogged heads, and other problems.
- Converting to a water-efficient landscape through proper choice of plants and careful design can reduce outdoor water use by 20 to 50 percent.
